## Role

Voice Agent & Complaints Handling

## Tech Stack

FastAPI Python gTTS SQLite REST API (v1)

### 1. Voice Agent

- Worked alongside Shalini on the voice agent — the speech layer used to narrate generated video content (gTTS-based text-to-speech).
- Focused on the input/handling side: turning script text into a clean voice-ready format before it's passed to speech synthesis.

**How it works:** Content Agent produces the script → voice agent prepares and formats it → gTTS generates the audio → audio is handed to the video assembly step.

### 2. Complaints

- Built the complaints handling flow — capturing user/customer complaint input, storing it (SQLite), and routing it for review/response, separate from the marketing content pipeline.

**How it works:** complaint is submitted → stored as a record in the database → flagged/routed so it can be reviewed and actioned, with a status field similar in spirit to the content queue's `pending` → `approved` pattern.

## Notes

Fill in the specific complaints schema/fields, the exact routing logic (who/what it's routed to), and any file paths (e.g. `complaints.py`, `voice_agent.py`) before committing to GitHub.
